EDUCATION

University of Washington

Pursuing Bachelor of Science in Computer Science

Seattle, WA

Expected Jun 2030

Bellevue College

Associate in Science Track II: Electrical & Computer Engineering

Bellevue, WA

Jun 2026

GPA: 4.00

- CS 211: Fundamentals of Computer Science II and CS 210: Fundamentals of Computer Science I.
- ENGR 204: Electrical Circuits, MATH 255: Vector Calculus, and MATH 238: Differential Equations.
- MATH 208: Introduction to Linear Algebra

EXPERIENCE

Bellevue College

Math Lab & Drop-in Tutor

Bellevue, WA

July 2025 – June 2026

Provided 1-on-1 tutoring 15–20 students weekly across the full calculus sequence, linear algebra, and drop-in physic kinematics.

Built lasting tutor-student relationships through consistent, repeat sessions, helping students independently complete coursework and demonstrably improve their grades.

CRLA Level 1 Certified.

Daiso Industries Co.

Associate Store Sales

Redmond, WA

Aug. 2024 – Sept. 2024

Ensured smooth daily retail operations by managing financial transactions, maintaining organized merchandise displays, and restocking inventory.

Delivered consistent, compassionate customer service across diverse customer needs, escalating complex issues to management when appropriate.

Math Club

Co-President

Kirkland, Washington

Sept. 2024 – Jun. 2026

Elected via formal election and interview process after serving as Treasurer, applying prior experience in budgeting, documentation, and event planning to delegate responsibilities across an executive team.

Grew active competition participation from 8 to 25 students year-over-year by revising meeting structure and outreach; coordinated logistics for state level competitions.

PROJECTS

Latent Flow Matching: Implemented class-conditional rectified flow matching as a latent diffusion model, training a pure MLP with sinusoidal time embeddings and residual blocks to learn the velocity field between noise and β -VAE-encoded MNIST digits. Applied classifier-free guidance via label dropout, producing high-quality, controllable digit generation; analyzed the loss landscape, identifying a theoretical loss floor near 0.4 driven by the latent space's dimensionality. Code available on GitHub.

GPT 2 (124M): Pretrained a 124M-parameter GPT-2 from scratch on FineWeb, distributing training across 8xA100 GPUs via DDP with gradient accumulation, sustaining 400K tokens/sec and completing training in around one hour. Architecture designed to support downstream evaluation on benchmarks like HellaSwag. Code available on GitHub.

Java Autograd & MNIST Classifier: Built a lightweight scalar-valued automatic differentiation engine from scratch, utilizing DAGs and topological sort for backpropagation. Trained a multi-layer perceptron on MNIST to validate the framework, achieving 96% validation accuracy. Summary paper available on Github.

osu!web: Contributed 5+ merged pull requests to osu!web: extended the /matches API endpoint to support filtering by active status, and shipped frontend improvements including beatmap favorite tooltips, standardized playcount/favorites display ordering, and cleanup of zero-value entries in user profile pages.

SKILLS & PASSIONS

Languages & Tools: Java, Python, PyTorch, Git, Linux/Unix, Slurm.

Passions: Machine learning, linear algebra, distributed systems and networks.
